Complete solution for Euroma

An innovative production location for Euroma

After almost seventy years, Euroma is moving back to where it all started: Zwolle. This successful supplier of herbs and spices has been developing products for over a hundred years using spices from all over the world. Because production was continuing to grow, Euroma went looking for a new production site. They decided to go back to Zwolle, where the company was founded in 1899. Lalesse Logistic Solutions is developing and realising the complete internal logistics at this innovative production location.

Racking as supports for the building

The first racks for the warehouse were put in place in mid-May. The racks are structural elements that support the wall and roof. This type of silo construction is different from standard structures, in which the racks are placed in an existing building. The high-bay warehouse is 27 metres tall. Its facilities include six automatic pallet cranes and two mini-load cranes and it will have room for 18,000 pallets and 8,000 mini-load positions.

The warehouse is part of a hypermodern production site that will have not only production operations, storage and office space but also an innovation centre. The strategic location on the A28 motorway allows goods to be delivered and dispatched quickly and efficiently. There is enough space on the site for them to be able to grow further in future.

All the components of internal transport

In addition to the racks and cranes, Reesink Logistic Solutions and its partners will be supplying everything that is needed for the internal transport, from roller conveyors and lifts to the WMS that integrates all the components together. The total

solution ensures that all the raw materials and other items that are required arrive at the right place at the right time, efficiently and automatically. From goods inwards to production, from packaging to storage.

A lot of hard work is being done together with the construction company Aan de Stegge and various partners to make sure that the production location can be delivered in the first half of 2019. If you're interested in how it's progressing, you can follow the construction work via the building site's webcam.

Highest point Euroma warehouse reached

The building process of the new Euroma warehouse in Zwolle is in full swing. As we speak several product groups are implemented. The first three of in total six Lalesse stacker cranes have been installed, as well as two mini load cranes placed above each other (see picture 5 and 6). Racking are installed at high speed and October 3 the highest point was celebrated.

Not only in Zwolle the production is in full swing. At the production location in Duiven a lot of work is being done on the construction of the conveyors. A total of 500 meters of conveyors will be installed in the warehouse. The elements are transported assembled to the site, so that the installers men on site can install them as quick and efficient as possible.
